

## iMac lineup revamped: Thunderbolt, faster processors and super graphics card

**Apple** today updated its **iMac** all-in-one desktops, adding Intel's second-generation quad-core Core i5 and Core i7 CPUs and Thunderbolt superfast speed data transfer ports.

Along with the updated CPUs and the new high-speed ports (two in the 27" version), the new iMacs sport faster Advanced Micro Devices' graphics processors than their predecessors (6xxx family) and integrated FaceTime HD video cameras.

The upgrades are in keeping with the rumors that appeared on the 'net and elsewhere over the past few months and will bring us, even in the lightest flavour, a quad-core iMac faster than ever at a really low price.

Where to look for? [Apple.com](http://Apple.com)!
