

With 3000 new APIs, is Mac OS X 10.8 a major upgrade?

First hints from Apple:

- new Mail,
- Autosave feature OS-wide
- Launchpad: gesture OS-wide that run any desktop app
- Mission Control: a new tool to control all Macs inner workings
- gesture control over most apps
- full screen apps (and a new paradigm for developers)

I like AirDrop: a new USB-drive killer that's a peer-to-peer Wi-Fi data exchange protocol that resembles a lot bluetooth pairing and photo sharing.

It will be really useful among all users.
