

Nikon D800: the best DSLR yet - or the next ultimate video making tool?

✘ **Nikon** just released the **Nikon D800**, a professional full-frame DSLR with a staggering **36 megapixels resolution**, an impressive features list and a tag price that's high but definitely not unaffordable (if a \$3,000 price tag doesn't scare you).

Its resolution alone overshadows most other DSLR around (including high-end Nikons) and arch-competitor Canon DSLRs.

Not only does the D800 replace the (now) older D700 in the more affordable less-than-top full-frame DSLR area, it's already building a strong reputation as a videomaker's dream. Core technologies borrowed from the over-the-top **Nikon D4**, FX lenses, combined with its light body and 1080p video shooting have already produced some great result.

Here comes a video shooted completely with D800s - and with some compelling backstage footage too.
