

Time has come for the new **Xbox One** from Microsoft, soon a worldwide-event will introduce the brand-new third generation Xbox console.

Some specs?

The new **Xbox One** include an 8-core processor, 8 GBytes of RAM, Blu-ray player, USB 3 ports, HDMI (of course) and a 500GB hard drive.

Besides all of this, Microsoft is promising a new operating system fusing Xbox and Windows. The Xbox One architecture has (reportedly) “three operating systems in one”: and Xbox, a kernel of Windows (somehow resembling Windows RT), and a multitasking interface.

A new **Kinect** will be introduced too with the Xbox One with improved accuracy and a 1080p camera, Skype connectivity, and understanding of rotational movement in a structure like skeleton.

Microsoft even claims the new Kinect can read your heartbeat.

Same goes for the New Controller: Xbox controller’s gotten a revamp with an integrated battery, improved ergonomics, a better d-pad, and improved-response triggers.

SmartGlass anyone?

The tablet-based SmartGlass experience *will be around* on Xbox One, and will work as before with a variety of phones and tablets.

More info upcoming.
