

How to edit text in your browser - without launching an editor!

A **simple text editor** - always available at your fingertips?
It's inside your browser!

It's just a matter of writing in the location/URL textbox of your browser the following text and start typing:

data:text/html, <html contenteditable>

You'll get a very simple text editor within your browser so that taking a quick note will never be an issue any more (for me, at last!).

Tested under Firefox (PC/Mac), Chrome (PC/Mac), Safari (Mac)
