

Mozilla Firefox (experimental) Containers introduces multiple accounts in single browser

[Mozilla Firefox Nightly](#) (the developer release, ahead of the regular browser for most users) has introduced **Containers** experimental support: now you can use at least four different profiles - and separate accounts.

It may be the *last time we all need to have several browsers opened at once in order to manage different accounts on social networks thanks to containers technology.*

Mozilla Firefox (experimental) Containers introduces multiple accounts in single browser

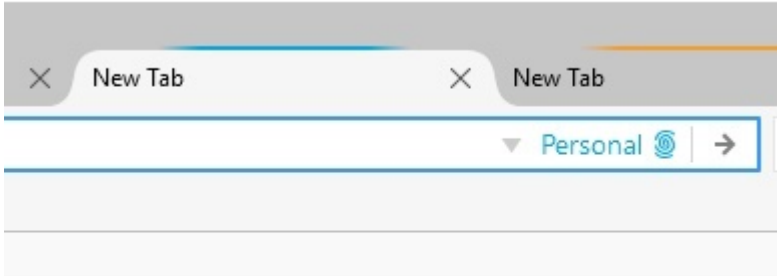

I've been using for a couple of week or so this browser on a Windows 10 PC and has been experimenting using several Twitter accounts at once - successfully; it's been working quite well with Facebook as well.

I've been experiencing some minor troubles with Google accounts, which sometimes "jump the fences" but this may be fixed by the time it gets to the final release.

### How does it work?

You *simply* open a new tab (or a window) with one of the four available browsing profiles (**Personal, Work, Banking, Shopping**) and get a browsing session accordingly.

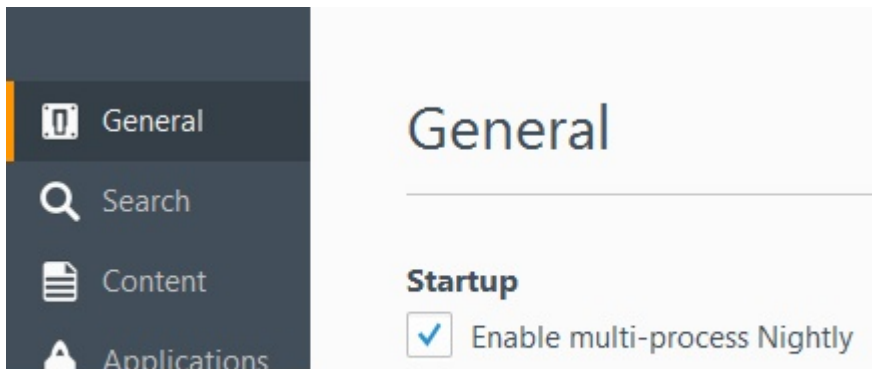

Mozilla Firefox (experimental) Containers introduces multiple accounts in single browser

A reminder icon at the end of URL will help you know exactly which profile you're using.

In the past, I've been using Mozilla Prism [FluidApp](#) and [Mozilla Prism](#), which are single-site-browsers, attempting to open a single browser instance for, as an example, facebook or gmail and trying to avoid site clutter and crashes, but container technology is really awesome and highly promising.

Under the usual **Settings** panel, you have to enable "**multi-process Nighthly**", in order to separate multiple accounts.

**Containers technology** seems the buzzword, these days (and [Docker](#) seems like it's the new frontier)
